What is Diffuse Epithelioid Malignant Mesothelioma ...

Mesothelioma is a type of cancer that develops in the lining that covers the outer surface of some of the body's organs. It's usually linked to asbestos exposure. Mesothelioma mainly affects the lining of the lungs (pleural mesothelioma), although it can also affect the lining of the tummy (peritoneal mesothelioma), heart or testicles.

Mesothelioma - NHS

ABSTRACT: Diffuse malignant pleural mesothelioma is a rare and aggressive malignancy of the pleura that is usually caused by exposure to asbestos. Between 2,000 and 3,000 new cases are expected to be diagnosed annually in the United States. Difficulties in diagnosis, staging, and treatment set this disease apart from other malignancies.

Mesothelioma - Wikipedia

Context Ionizing radiation has a role in the development of malignant mesothelioma, in several epidemiologic studies, including patients with hematologic malignancies.

Malignant (Diffuse) Mesothelioma in Patients With ...

Abstract Pleural mesothelioma has been diagnosed in 52 patients in three hospitals on Merseyside between 1955 and 1970, 60% being diagnosed from operation specimens and the rest from postmortem tissues. Necropsies eventually held on nearly half the operation cases confirmed the diagnosis, giving a necropsy rate of 70% for the series.

Diffuse malignant pleural mesothelioma and asbestos exposure

Malignant mesothelioma is a highly aggressive primary neoplasm of the serosal lining of the pleura, peritoneum, pericardium, or tunica vaginalis. Primary diffuse malignant peritoneal mesothelioma (DMPM) is a rare clinical entity. Only 33% of those diagnosed with DMPM have a history of asbestos exposure.

Diffuse malignant peritoneal mesothelioma - ScienceDirect

The localized peritoneal mesothelioma harbored a nonsense CHEK2 mutation, and the well-differentiated papillary mesothelioma with invasive foci harbored no reportable variants. In conclusion, we described the genetic categories of diffuse malignant peritoneal mesotheliomas, with BAP1-mutant and BAP1-wild-type groups.

Molecular characterization of diffuse malignant peritoneal ...

Pleural diffuse malignant mesothelioma typically presents during the seventh decade of life and has poor prognosis. Recent epidemiologic studies have shown differences between young and older mesothelioma patients, but the biology of pleural mesothelioma in young patients is poorly understood.

Clinicopathologic and genetic characteristics of young ...

The records of ,37 patients with diffuse malignant mesothelioma of the pleura were studied. Thirty two of the 37 patients were men and five were women. Their ages ranged from 20 to 79 years, with an average age of .'5.'5 years. The average a-e of the patients with tubulopapillary mesothelioma was 57 years. with fibrous 58 years, and with ...

Diffuse Malignant Mesothelioma of the

Biphasic diffuse malignant mesothelioma present in the sarcomatoid area (original magnification x200). The immunohistochemical results are summarized in Table 2. EGFR was expressed in a membranous pattern in all but 2 cases (94%). The staining intensity generally was diffuse and strong, and was +4 in 22 cases (63%).

Diffuse malignant mesothelioma of the peritoneum - Nonaka ...

Malignant mesothelioma (MM) is a rare and, in majority of cases, highly aggressive tumor. It arises from the mesothelial cells lining serous cavities (pleura, pericardium, peritoneum, and tunica vaginalis). In Western countries, incidence of MM is still slowly increasing, and should be reaching its peak in this decade (1 - 5).
