Host-Parasite Relationship (With Diagram)

Parasitism is the relationship between two organisms of the same or different species in which one lives on or inside the body of the other and obtains food and nourishment causing harm to this organism. The organism which is thus benefitted from such association is called parasite and the other which is harmed is known as host.

Host-Parasite Relationship and their Evolution

Host-parasite relationships. In the context of communicable disease, the host-parasite relationship must be considered not only with respect to the individual host-parasite interaction but also in terms of the interrelationship between the host and parasite populations, as well as those of any other host species involved.

Virulence Factors. Host-parasite interactions contribute to the infection by initiating signaling events in both cells. These interactions involve the pathogen and the host cell surface, and this step is critical in the understanding of microbial pathogenicity. The heterogeneous and biochemical complex of the microbial surface exhibit molecules (adhesins) that are involved in the virulence of the parasites.

Parasitism - Wikipedia

You cannot always see parasites - but a whopping 75% of the world's creatures are parasitic. The average human is known to host over a million of them! If you don't have at least one kind of worm residing in your guts, you're in the minority. Over three-quarters of the world's population keep them cosy.

Many illuminating facts about host-parasite relationships were given. The final paper was by G. S. NELSON (p. 75) on Factors Influencing the Development and Behaviour of Filarial Nematodes in their Arthropodan Hosts. These filarial nematodes depend for survival on association between a definitive host and arthropod vector, and the species number one thousand or more.

In a parasitic relationship, the parasite benefits while the host is harmed. Parasitism takes many forms, from endoparasites that live within the host's body to ectoparasites and parasitic castrators that live on its surface and micropredators like mosquitoes that visit intermittently. Parasitism is an extremely successful mode of life; about 40% of all animal species are parasites, and the average mammal species is host to 4 nematodes, 2 cestodes, and 2 trematodes.
