Abstract ISO 1940-1:2003 gives specifications for rotors in a constant (rigid) state. It specifies balance tolerances, the necessary number of correction planes, and methods for verifying the residual unbalance.

ISO 1940-1 was prepared by Technical Committee ISO/TC 108, Mechanical vibration and shock, Subcommittee SC 1, Balancing, including balancing machines. This second edition cancels and replaces the first edition (ISO 1940-1:1986), which has been technically revised. The most important change is the introduction of reference planes for balance tolerances instead of using the correction planes as ...

INTERNATIONAL STANDARD 1940-1

ISO 1940/1 is an international standard used for qualifying the balance of rotating rigid bodies. The standard also specifies the method for verifying residual imbalance. G0.4 is a particular balance grade within the overall standard.

...

Abstract This part of ISO 1940 gives specifications for rotors in a constant (rigid) state.

BS ISO 1940-1:2003 - Mechanical vibration. Balance quality ...

International Standard ISO 1940/1 is a widely-accepted reference for selecting rigid rotor balance quality. This paper is presented as a tutorial and user's reference of the standard and its practical applications. A simplified method is shown for determining permissible residual unbalance for various rotor classifications.

Balance Quality Requirements of Rigid Rotors  
Balance Quality Grade ISO 1940/1 What is mean by G 0.4, G 1.0, G 2.5, G 6.3 and so on? G is the product of specific unbalance & the angular velocity of the rotor at maximum operating speed. What is specific unbalance? Specific unbalance - center of gravity displacement of rotor.

Balancing requirement according to iso 1940  
ISO 1940 is obsolete and has been replaced with ISO 21940-11, edition 2016-11-15. The EasyBalance software Tolerance Calculator has been updated to this new ISO standard. NOTE 1 Typically, completely assembled rotors are classified here. Depending on the particular application, the next higher or lower grade may be used instead.

Example Number 1: Fun impeller . Maximum service speed = 1500 RPM . Mass  $M = 200$  kg Left, right side correction radius  $R_s = R_d = 800$  mm Balancing quality  $G = 6,3$  From previous diagram we obtain: Total acceptable residual eccentricity  $e_t = 40$  m Total acceptable residual unbalance  $U_t = M \cdot e = 200$  kg ...

When balancing a tool to ISO 1940-1 balancing class G 2.5 at 20 000 rpm it is allowed to have an unbalance at 1 g.mm/kg ( $e=1 \mu\text{m}$ ), see chart below. As an example a small Sandvik Coromant sticker corresponds to 4 g.mm. The ISO 1940/1 standard allows more unbalance on a heavier tool holder than on a lighter one at the very same rotational speed.
