Edwin M. Lemert. Theory. In his book Social Pathology, published in 1951, Lemert developed the concept of secondary deviance. He developed this perspective further in 1967 in his book Human deviance, social problems, and social control. Although Lemert himself preferred the concept of social reaction to labeling, Lemerst's distinction between primary and secondary deviance is a decisive development in the formulation of labelling theory.

Secondary deviance. The idea of primary and secondary deviance comes from the interactionist, Lemert. If one acts in an isolated deviant way, this is primary deviance; however, the societal reaction to that action could lead to secondary deviance. In other words, if that person is then labelled as deviant and internalises that label, then subsequent deviant acts are secondary deviance: the result of the societal reaction to primary deviance.

For Edwin Lemert, primary and secondary deviances are the ways to explain the labeling process. It is after the primary deviance that a person can be labeled or not. When we analyse the similarities and differences between primary and secondary deviance, we can see that in both cases there is a violation of social norms.

Particularly, Edwin M. Lemert in Social Pathology shaped the tripartite distinction between 'primary deviance' (exploratory behaviour that is situational or occasional), 'societal reaction perspective' (how others respond to the primary deviance), and 'secondary deviance' (how the deviant responds to the social reaction resulting in a deviant identity) (1951 : 603).
