Processes in Microbial Ecology discusses the major processes carried out by viruses, bacteria, fungi, protozoa, and other protists—the microbes—in freshwater, marine, and terrestrial ecosystems. The book shows how advances in genomic and other molecular approaches have uncovered the incredible diversity of microbes in natural environments and unraveled complex biogeochemical processes carried out by uncultivated bacteria, archaea, and fungi.

These processes are in turn affected by ecological interactions, including competition for limiting nutrients, viral lysis, and predation by various protists in soils and aquatic habitats. The book neatly connects processes occurring at the micron scale to events happening at the global scale, including the carbon cycle and its connection to climate change issues.

Microbial ecology can be used to judge the efficiency of the biological processes; stalked ciliates in the activated sludge demonstrate healthy sludge age and reliable organics removal. If microbial ecology is dominated by pathogens, treatment efforts must be focused on disinfection before safe resource recovery can be guaranteed.

Microbial Ecology - an overview | ScienceDirect Topics

Establishing appropriate spatial scales for studying microbial processes is an outstanding challenge: microorganisms can orchestrate ecosystem functioning across whole biomes (Sheffer et al. 2015), yet fungi exhibit low mobility on tree barks (Koufopanou et al. 2006; Robinson, Pinharanda and Bensasson 2016), and an air void in soil can be an insuperable barrier for a bacterium.

Fifty important research questions in microbial ecology ...

Microbial ecology is the ecology of microorganisms: their relationship with one another and with their environment. It concerns the three major domains of life—Eukaryota, Archaea, and Bacteria—as well as viruses. Microorganisms, by their omnipresence, impact the entire biosphere. Microbial life plays a primary role in regulating biogeochemical systems in virtually all of our planet's environments, including some of the most extreme, from frozen environments and acidic lakes, to ...

This book, which discusses the major processes carried out by viruses, bacteria, fungi, protozoa, and other protists – the microbes – in freshwater, marine, and terrestrial ecosystems, focuses on biogeochemical processes, starting with primary production and the initial fixation of carbon into cellular biomass.
