 Shotcrete, gunite (/ na 1 /), or sprayed concrete is concrete or mortar conveyed through a hose and pneumatically projected at high velocity onto a surface, as a construction technique, first used in 1914. It is typically reinforced by conventional steel rods, steel mesh, or fibers.

Shotcrete—Wikipedia
 Shotcrete is the process of placing concrete to achieve high strengths and low permeability. American Concrete Institute's (ACI) "Guide to Shotcrete" defines Shotcrete as concrete (or sometimes mortar) conveyed through a hose and pneumatically projected at high velocity onto a receiving surface.

What Is Shotcrete? The Benefits of Using Shotcrete
 Shotcrete is more defined as a process than as a material or a product. Before you choose a piece of equipment for a job, you need to understand the different processes used in shotcrete placement.

 Shotcrete is defined as " mortar or concrete pneumatically projected at high speed onto a surface " (American Concrete Institute, 1990). There are two basic types of shotcrete—dry mix and wet mix. In dry mix shotcrete, the dry cement, sand, and coarse aggregate, if used, are premixed with only sufficient water to reduce dusting.

 The new shotcreting program hit four initial obstacles. First, under Contract CM019, the east and west caverns, in addition to all adjoining cross passages, Y caverns, and shafts, were to be drilled and blasted. With each blast, material was exca-vated and moved to a crusher in the lower levels. It was then loaded onto an underground conveyor

The Learning Curve—American Shotcrete Association
 Despite initial teething problems caused by clogging in the nozzle, the shotcreting process was born. Akeley eventually settled for a more sophisticated design predicated on the double-chamber principle: two alternatively pressurized chambers that pumped material into the conveying hose.

 Spiral exterior curtain walls which are supported on the outer edge of the spiral ramp were formed by shotcreting 5 inches of concrete from the inside of the building against carefully fabricated curved plywood forms. The inside surfaces of these walls were then furred, lathed and plastered, and the outside surfaces were smoothed and painted.

Shotcrete Testing—Who, Why, When, and How
 Properly applied shotcrete is a structurally sound and durable construction material which exhibits excellent bonding characteristics to existing concrete, rock, steel, and many other materials. It can have high strength, low absorption, good resistance to weathering, and resistance to some forms of chemical attack.

 Shotcreting a method in concrete work in which the concrete mix is applied in layers under the pressure of compressed air. Shotcreting is done with a special unit, which consists of a mortar gun or concrete sprayer and a compressor. A dry mix of cement and aggregate, usually sand, is prepared for shotcreting.

 Shotcrete and Guniting The process in both the methods involves spraying of the concrete or the mortar mix pneumatically with the help of a spraying gun or nozzle. This is done at a higher velocity on to the surface of application. When the mix used to spray is dry, the method is called as guniting.
