This volume contains the papers of the 19th International Congress of Computer Assisted Radiology and Surgery (CARS 2005) held in Berlin, Germany between 22 and 25 June 2005. For 20 years, CARS has developed a culture of innovation with its focus on interdisciplinary and international cooperation. In approximately 20,000 pages of proceedings written by several thousand authors from more than 50 countries, many innovative developments have been reported which now assist the daily practice of physicians in their care of patients. Examples are PACS, a concept on which CARS was founded, and computer assisted surgical tools and systems, which were initially reported in CAR 85 and have now become mainstream developments. Some of these innovations are incremental, making noticeable improvements in daily practice, but others like PACS or minimally invasive surgery are transformational innovations in a sense that they have fundamentally changed the way "things" are done. CARS has established itself as the major event for the presentation of R & D work of high actuality. In addition to the traditional scientific/medical sessions, some of the outstanding topics presented and which are included in the CARS 2005 conference proceedings include: Interventional Radiology; Colon and Liver CAD; Intra-Operative Imaging; Minimal Invasive Spine Surgery; PACS Beyond Radiology (in conjunction with EuroPACS); Surgical PACS and the Digital Operating Room (in conjunction with SPIE Integrating the Health Care Enterprise (in conjunction with EuroPACS). The process of innovation in these fields is a continuum with many examples of other new developments being presented at CARS 2005, which marks the 20th anniversary of the congress.

In this new edition, the authors succinctly summarise clinical literature but also concentrate on both new entities and new concepts described since the publication of the third series ten years ago. The illustrations, with the exception of radiographs and electron micrographs, are in colour, and tumours are presented in detail. The continuing importance of tumour morphology in directing molecular studies is appropriately emphasised. In addition to the extensive discussion, illustrations, and up-to-date referencing of the numerous pancreatic tumours and tumour-like lesions, important discussions have been provided on normal gross, histologic and cytologic findings, and on pancreatic tumour staging. These discussions complement the authors' treatment of the often confusing issue of frozen section interpretation, dissection, and reporting of pancreatic resection specimens, and an ""unknown"" pancreatic biopsy or cytology specimen. This volume should be the definitive reference on pancreatic tumour for years to come.

Diagnostic Ultrasound Imaging provides a unified description of the physical principles of ultrasound imaging, signal processing, systems and measurements. This comprehensive reference is a core resource for both graduate students and engineers in medical ultrasound research and design. With continuing rapid technological development of ultrasound in medical diagnosis, it is a critical subject for biomedical engineers, clinical and healthcare engineers and practitioners, medical physicists, and related professionals in the fields of signal and image processing. The book contains 17 new and updated chapters covering the fundamentals and latest advances in the area, and includes four appendices, 450 figures (60 available in color on the companion website), and almost 1,500 references. In addition to the continual influx of readers entering the field of ultrasound worldwide who need the broad grounding in the core technologies of ultrasound, this book provides those already working in these areas with clear and comprehensive expositions of these key new topics as well as introductions to state-of-the-art innovations in this field. Enables practicing engineers, students and clinical professionals to understand the essential physics and signal processing techniques behind modern imaging systems as well as introducing the latest developments that will shape medical ultrasound in the future Suitable for both newcomers and experienced readers, the practical, progressively organized applied approach is supported by hands-on MATLAB® code and worked examples that enable readers to understand the principles underlying diagnostic and therapeutic ultrasound Covers the new important developments in the use of medical ultrasound: elastography and high-intensity therapeutic ultrasound. Many new developments are comprehensively reviewed and explained, including aberration correction, acoustic measurements, acoustic radiation force imaging, alternate imaging architectures, bioeffects: diagnostic to therapeutic, Fourier transform imaging, multimode imaging, plane wave compounding, research platforms, synthetic aperture, vector Doppler, transient shear wave elastography, ultrafast imaging and Doppler, functional ultrasound and viscoelastic models

Transcranial Sonography in Movement Disorders

Ultrasound and Carotid Bifurcation Atherosclerosis provides a comprehensive overview of the most recent advancements in instrumentation, imaging techniques including the use of contrast enhancement agents, plaque image analysis and its automation, elastography and plaque motion analysis; also, the use of ultrasonic and other biomarkers in the detection of the high risk cardiovascular individual. Finally, it deals with the application of IVUS, TCD and carotid plaque characterization in clinical practice and in stroke risk stratification. Ultrasound and Carotid Bifurcation Atherosclerosis is intended for all those working in the field of atherosclerosis, ultrasound imaging and cardiovascular risk, including the clinician, the vascular ultrasonographer, the epidemiologist, the molecular biologist, the biomedical engineer and the informatics scientist. Furthermore, this book bridges the gap between the researcher and the clinician, who is keen to incorporate the latest results of research to his daily practice.
